2. (HW &) SW Synthesis
3. Simulators
4. Verification / Validation
5. Runtime Support

## Synthesis at component level?

## SW synthesis > overview

### Task Management

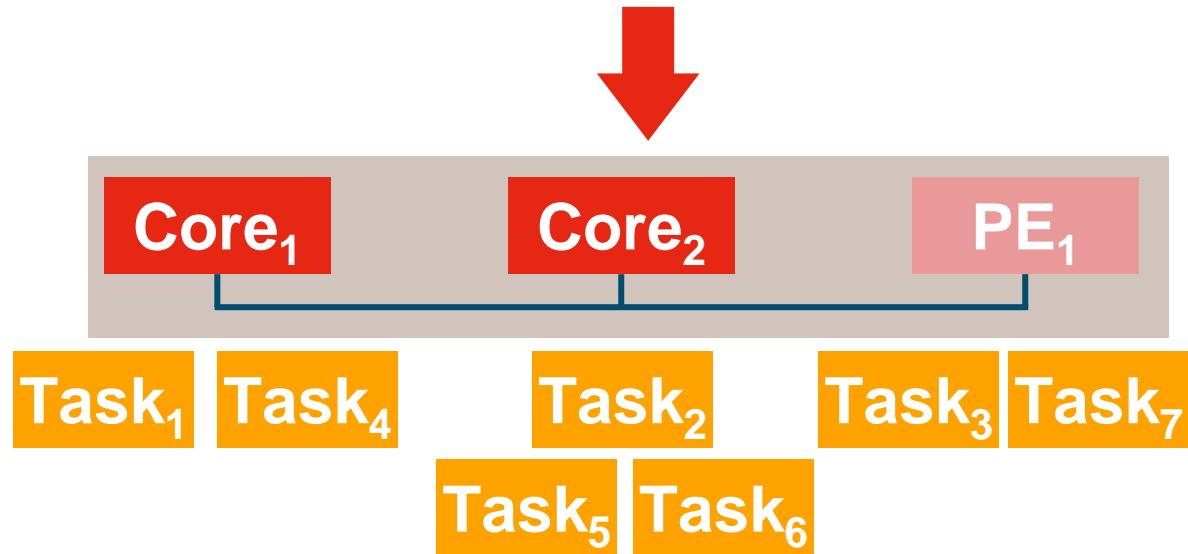

- Assignment (Mapping)
- Ordering (Scheduling)
- Timing

## SW synthesis > overview

### Task Management

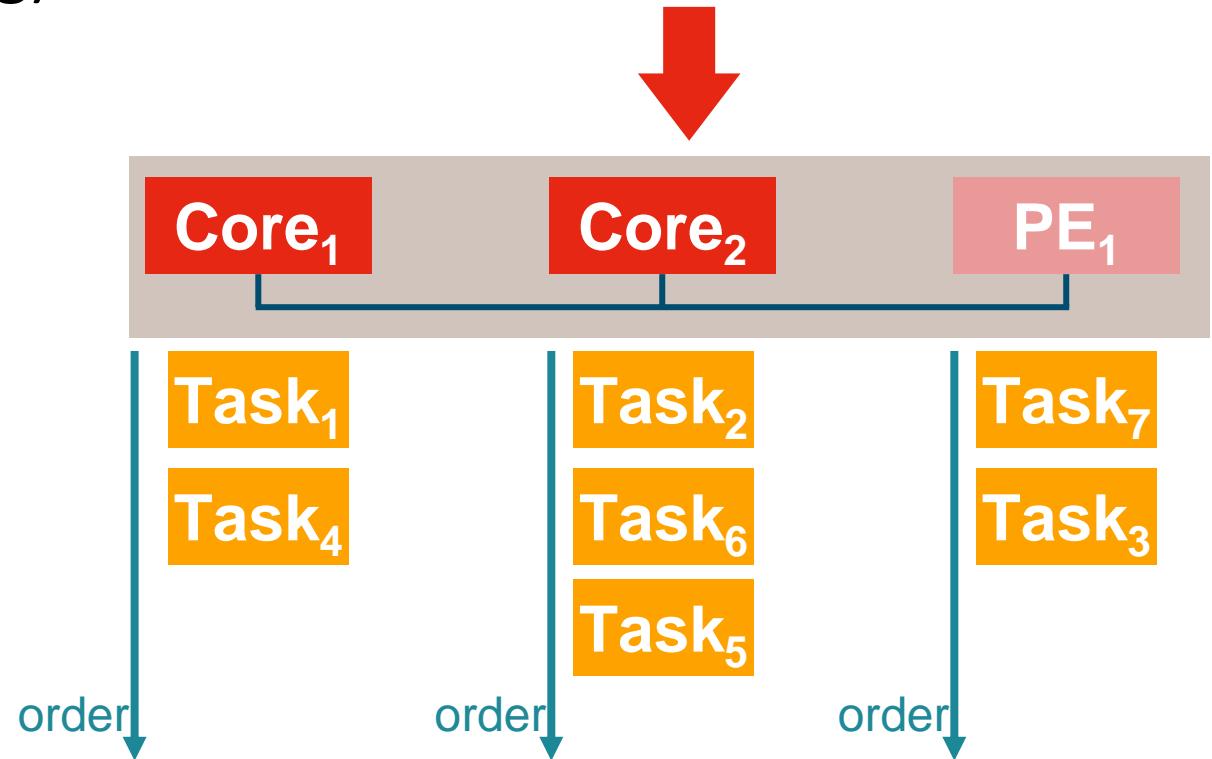

- Assignment (Mapping)
- Ordering (Scheduling)
- Timing

## SW synthesis > overview

### Task Management

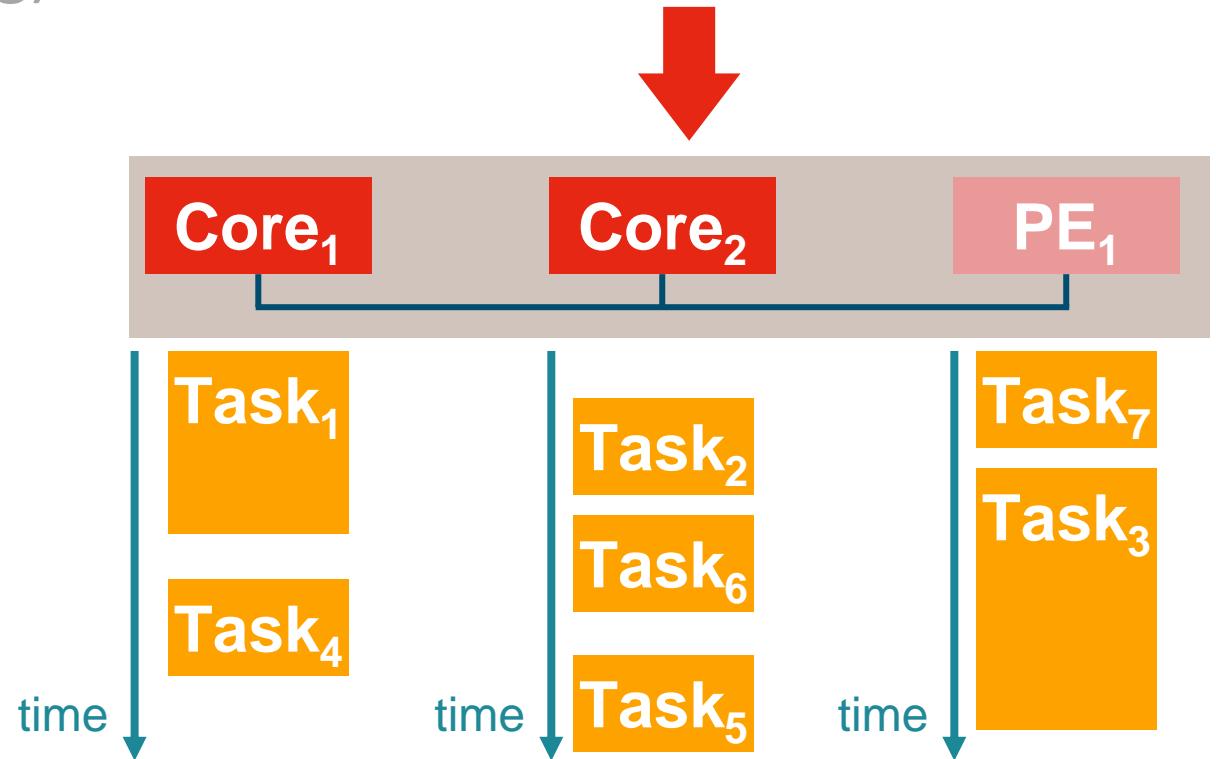

- Assignment (Mapping)
- Ordering (Scheduling)
- Timing

## SW synthesis > overview

### Task Management

- Assignment (Mapping)
- Ordering (Scheduling)
- Timing

## SW synthesis > HW management

### Task Management

- Assignment (Mapping)
- Ordering (Scheduling)
- Timing

### Memory

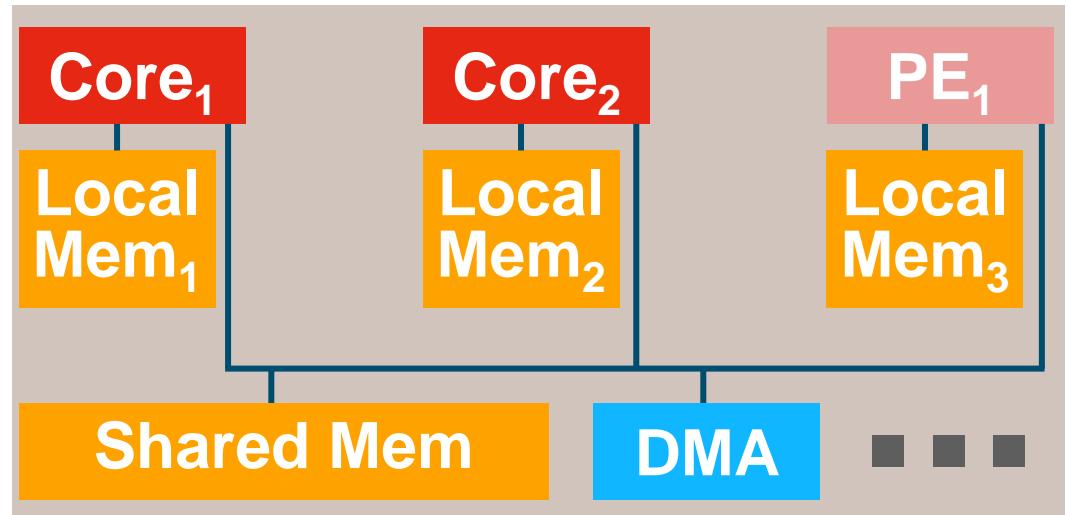

- Static Allocation
- Dynamic Allocation
- Model-based allocation

### Communication

- Direct copy
- DMA
- Ordering

### Synchronization

- Polling
- Interrupts

## SW synthesis > Complexity

### HW resources heterogeneity

- Processing Elements / Interconnect / Memory

### Limited HW resources

- PE / Interconnect / Memory

### SW model complexity

- Complex control dependency
- Complex data dependency
- Low predictability

## SW synthesis > Tools & methods objectives

**Optimizing / offering trade-offs between:**

- Latency / Response time
- Throughput
- Load balancing
- Memory footprint
- Power consumption

**Adaptability to any target architecture:**

- DSP
- GPU
- HPC

## Mapping/Scheduling > Problem

### Part of “Operational Research”

- How to organize a production line, train schedule, ...
- How to organize a project (Gantt Chart, ...)
- How to make decisions in general

### NP-Complete Problem

- Validity of a solution to the problem can be verified in polynomial time (e.g. verifying that a schedule is valid).
- No polynomial time algorithm for solving NP-complete problems is known (and it is likely that none exists).
- When the problem grows (e.g. number of cores or tasks), solving it is becoming more complex exponentially.

## Mapping/Scheduling > Solutions

### Heuristic algorithms

- Find a sub-optimal solution in polynomial time
- No guarantee on the solution quality

Constructive

#### Problem Specific

- List scheduling
- Greedy scheduling
- Hybrid flow-shop

Iterative

- FAST scheduling

#### Generic Algorithms

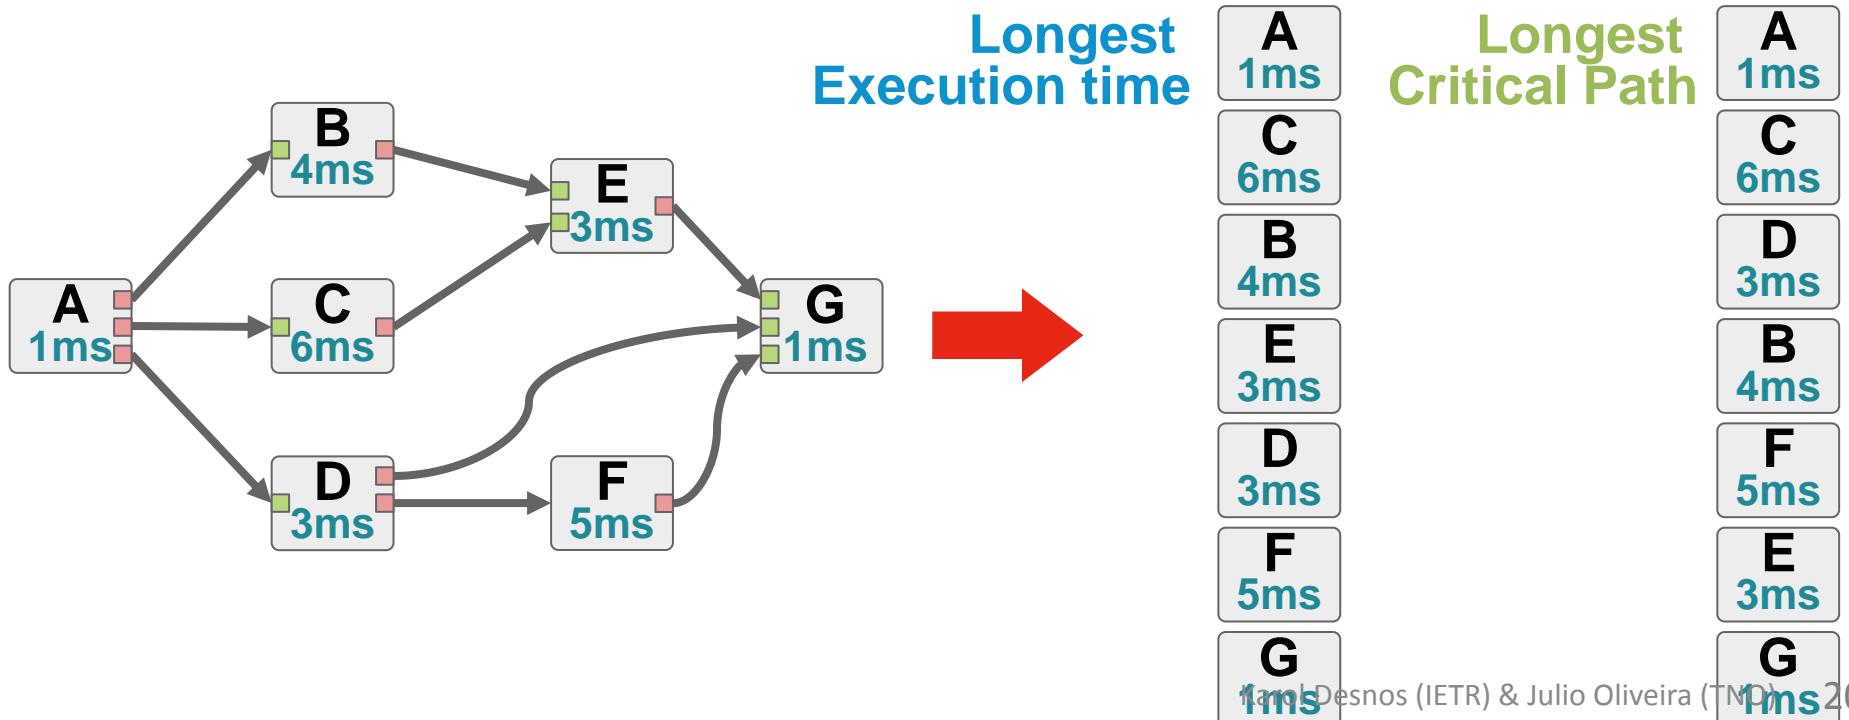

- Divide and conquer
- Branch and bound

- Integer Linear Programming
- Genetic Algorithms
- Simulated annealing
- Ant colony

## Mapping/Scheduling > List scheduling for dataflow

### 1. Create a list of actors sorted in:

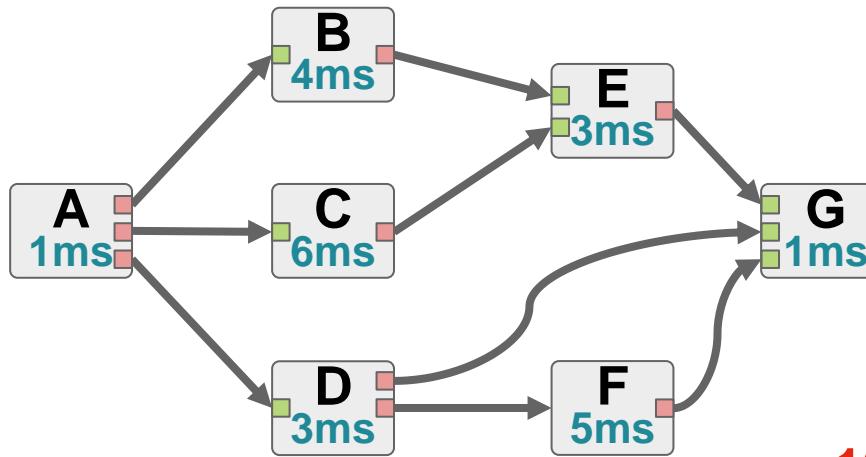

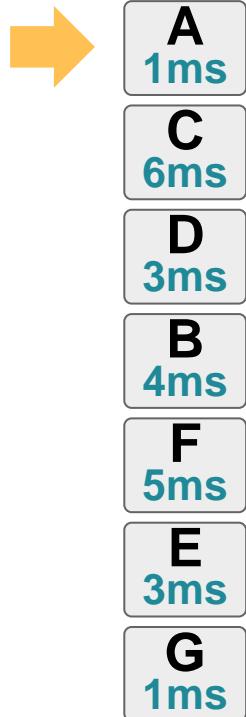

- Topological order (i.e. data dependency order)
- When equivalent, secondary sorting criteria is used:  
longest execution time, critical path before last task, ...

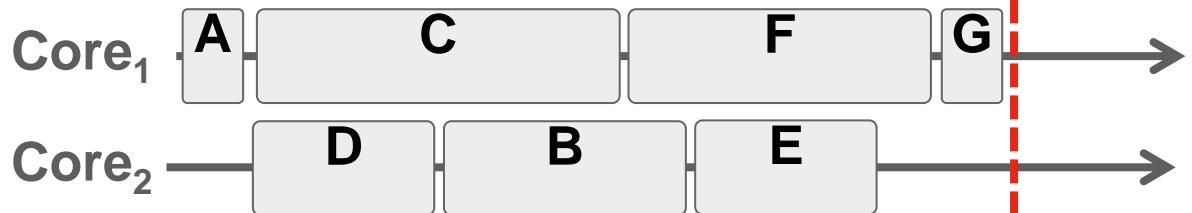

## Mapping/Scheduling > List scheduling for dataflow

2. Map and schedule actors to the first available PE:

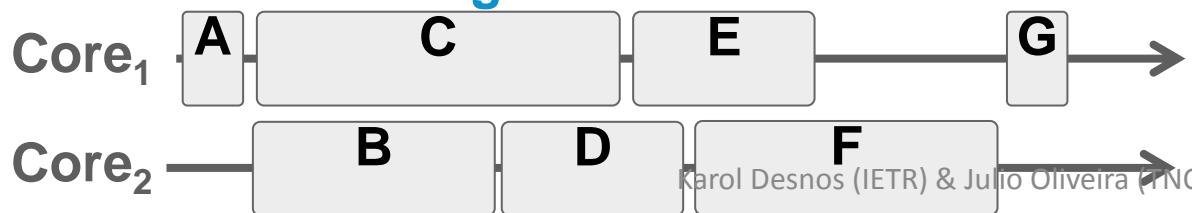

Longest Critical Path

13ms

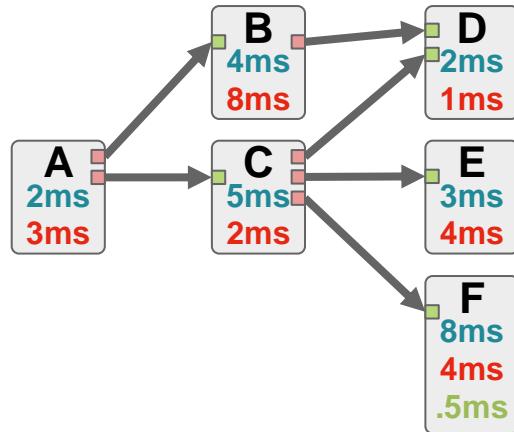

With longest execution time

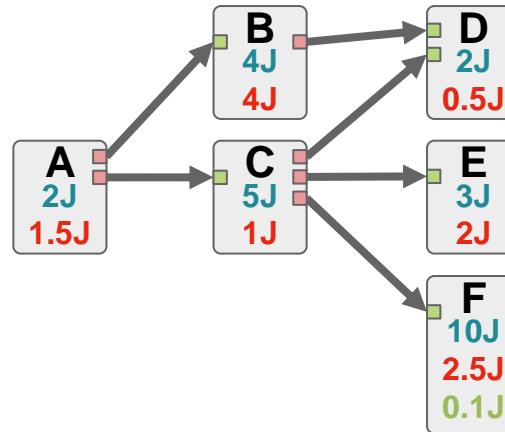

# Mapping/Scheduling > Multi-objective optimization

E.g. Latency and power on heterogeneous target.

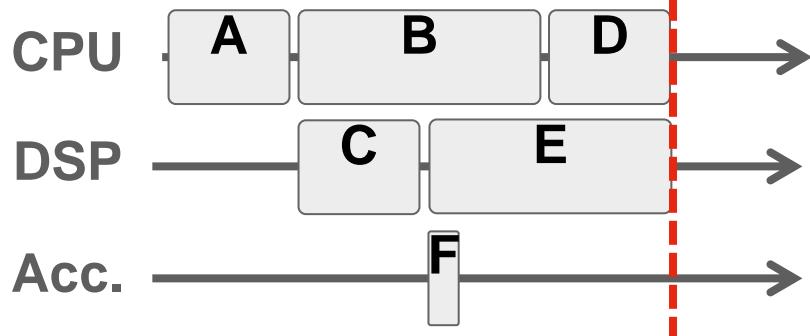

Time

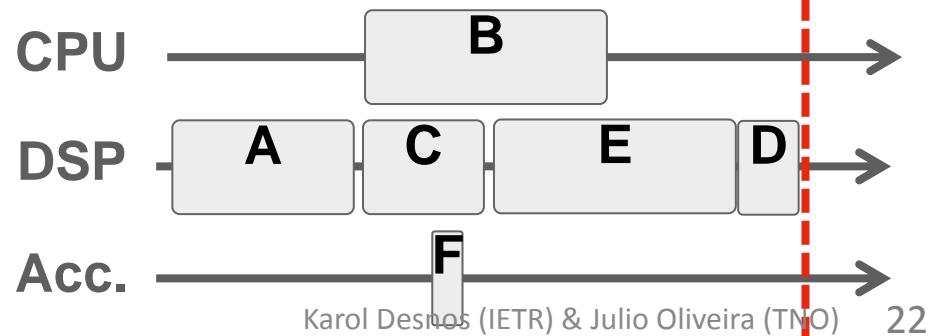

Power

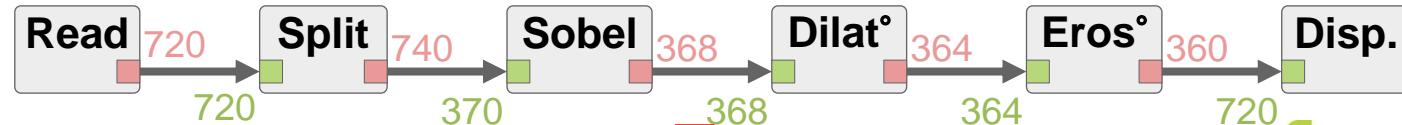

8ms – 11.1J

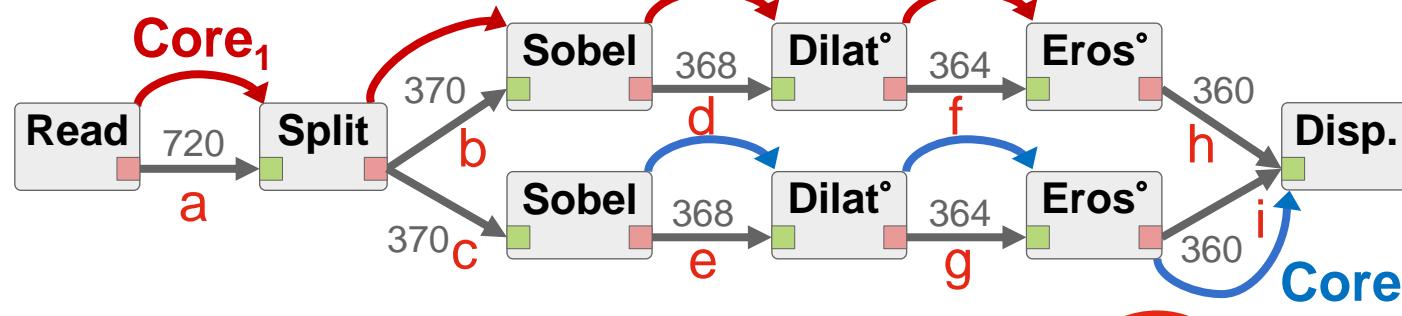

10ms – 9.1J

## Memory Allocation

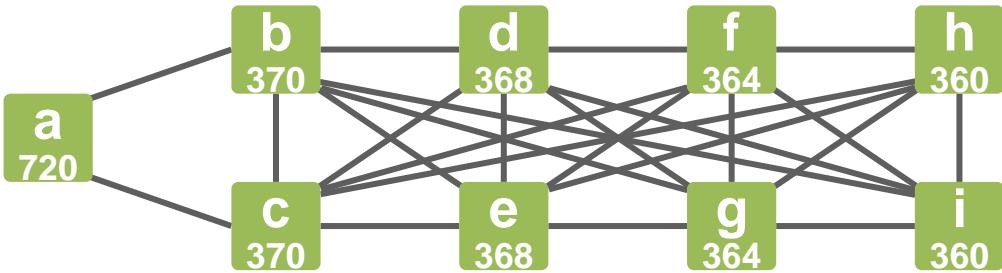

**1 Transform**

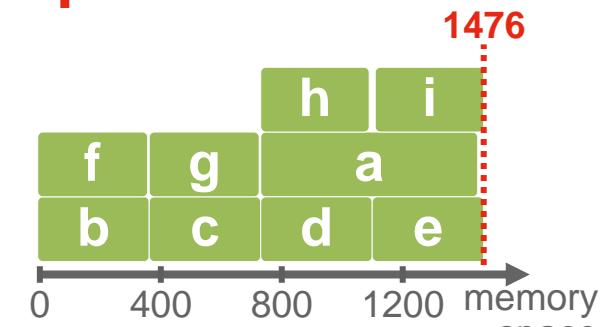

**2 Model**

**3 Update**

**4 Allocate**

Memory Exclusion Graph (MEG)

## Simulation

From Wikipedia, the free encyclopedia

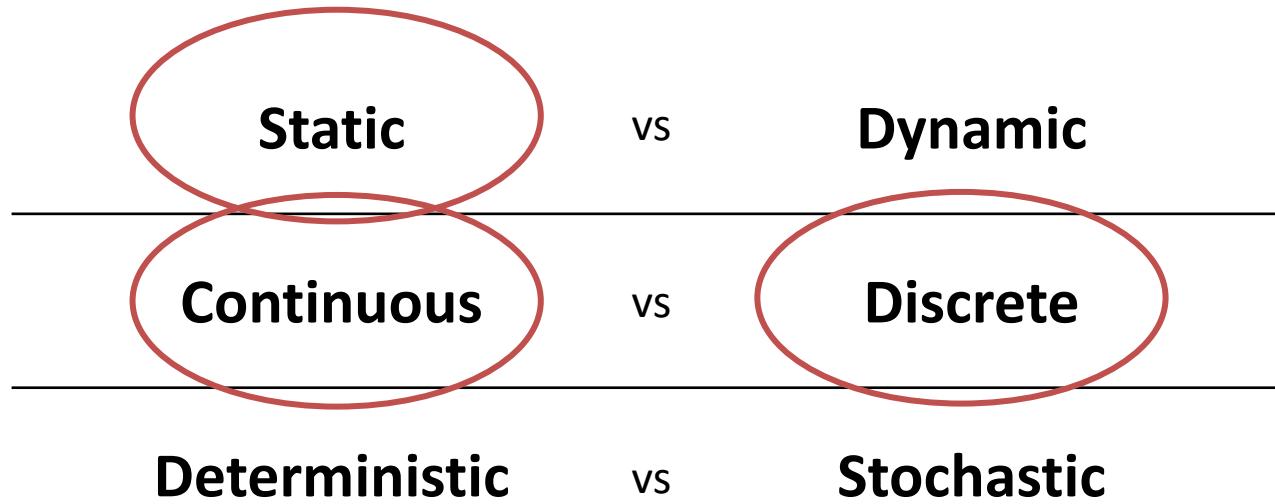

*Not to be confused with [Stimulation](#).*

*"Simulator" redirects here. For other uses, see [Simulator \(disambiguation\)](#).*

**Simulation** is the imitation of the operation of a real-world process or system over time.<sup>[1]</sup> The act of simulating something first requires that a model be developed; this model represents the key characteristics, behaviors and functions of the selected physical or abstract system or process. The model represents the system itself, whereas the simulation represents the operation of the system over time.

## Types of simulators

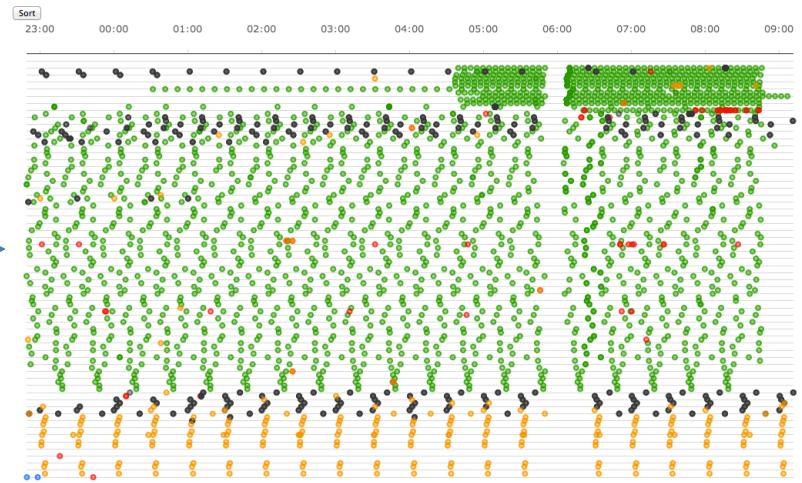

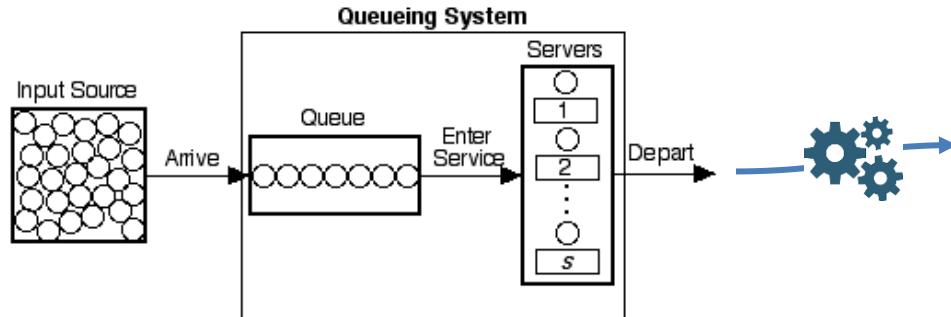

# Simulators

## So, if simulation is a game...

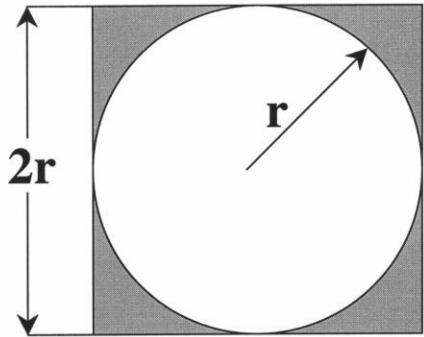

### What are the rules ?

### From a model to a game playing:

## Static simulations – the rules

$$\text{Area of Square} = 4r^2$$

$$\text{Area of Circle} = \pi r^2$$

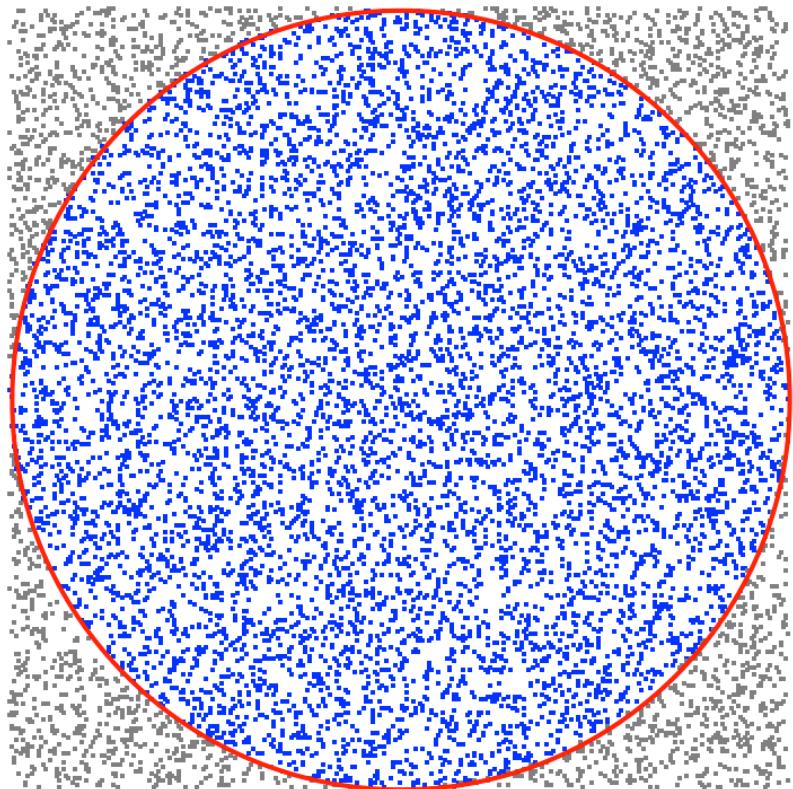

$$\begin{aligned}\text{Ratio of area of Circle to area of Square} &= \frac{\pi r^2}{4r^2} \\ &= \pi/4\end{aligned}$$

$$\text{Total number of throws} = N$$

$$\text{No. hits inside circle} = M$$

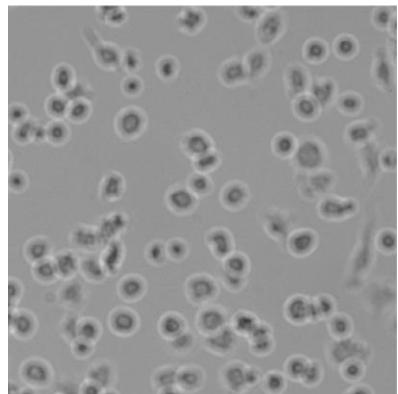

$$\text{Ratio of no. hits inside circle to total no. throws} = M/N$$

$$\pi/4 \approx M/N \Rightarrow \pi \approx 4 * M/N$$

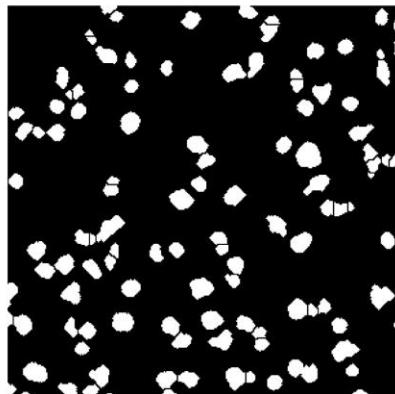

## Static simulations – Playing the game

Can you play the static simulation game to calculate the density of blood cells in a sample?

Reality

Model

Simulation Engine

$x, y \rightarrow$  random numbers

## Discrete event simulation – the rules

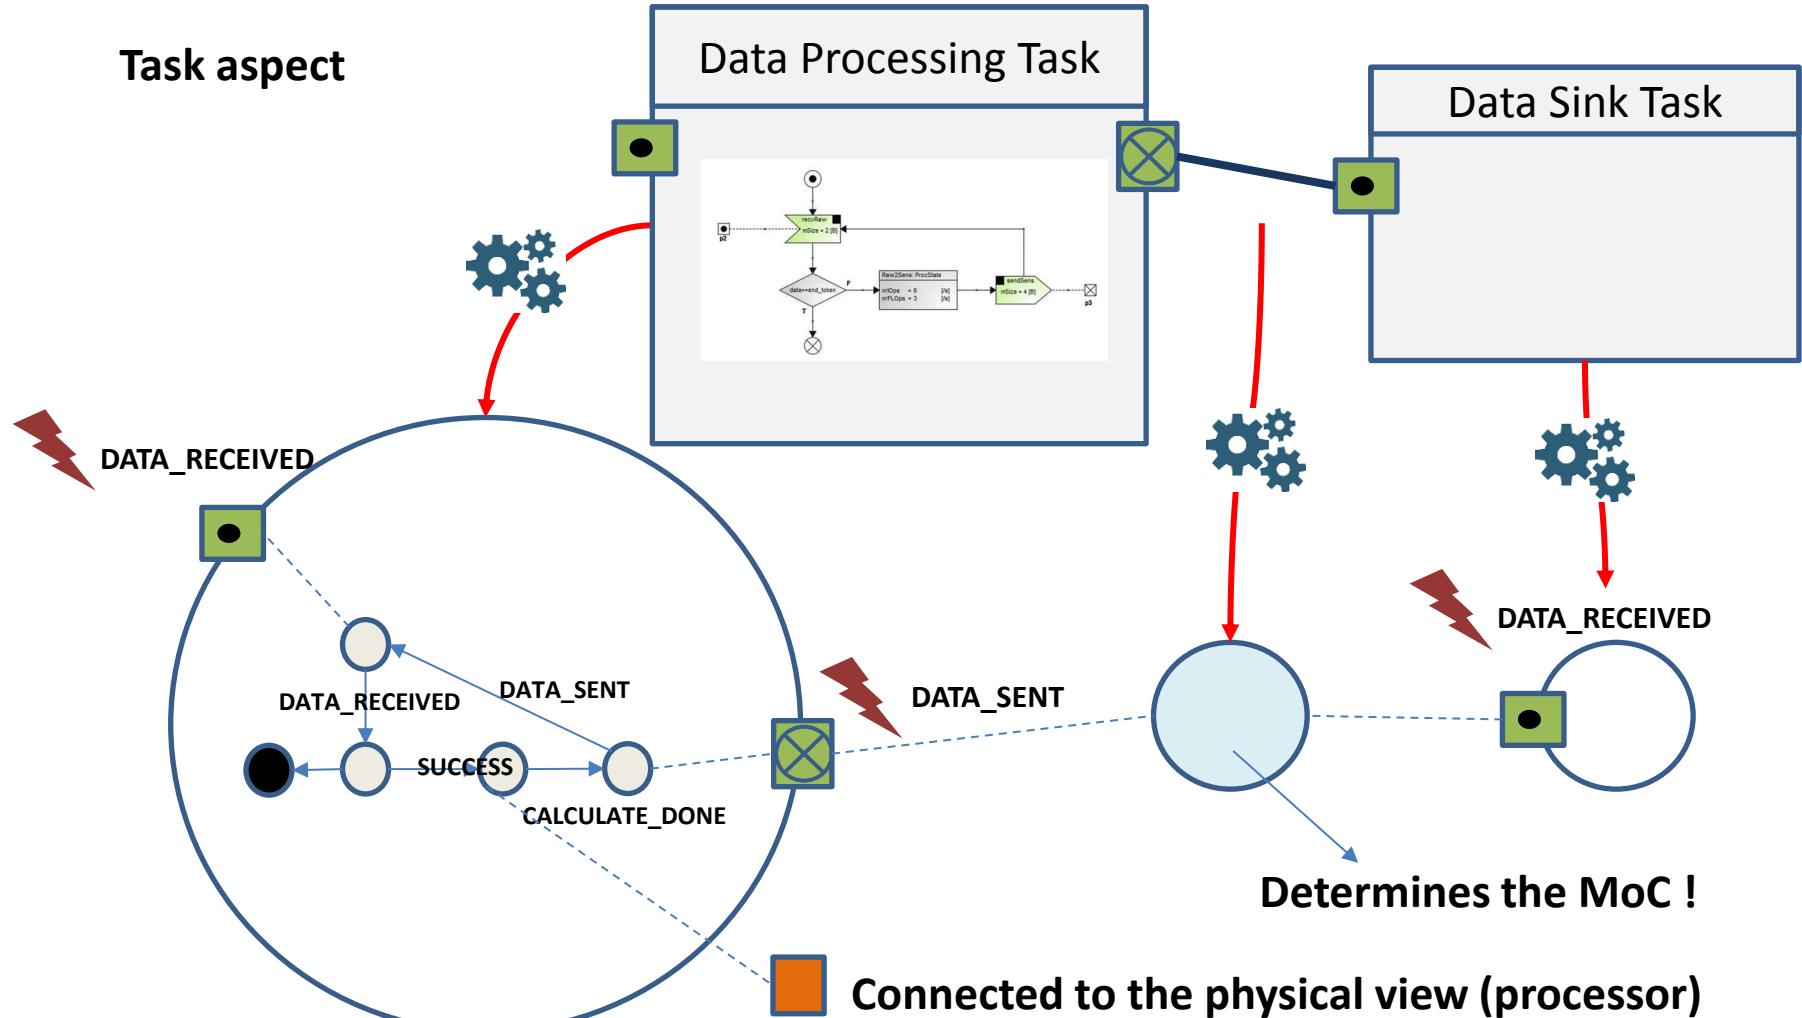

## DES – Playing the game : An example from DynAA

Behavior aspect

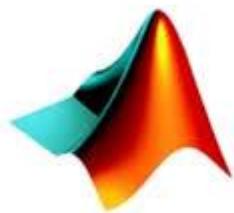

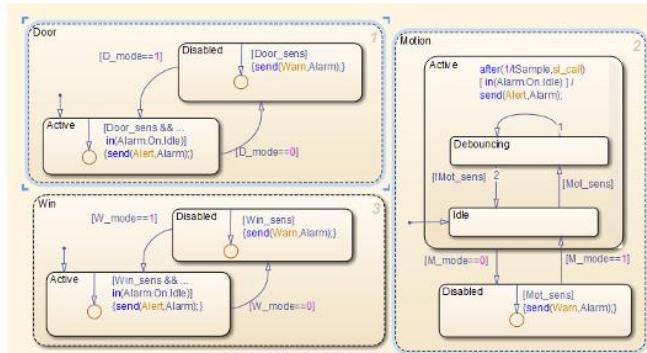

## DES – Playing the game : An example from DynAA

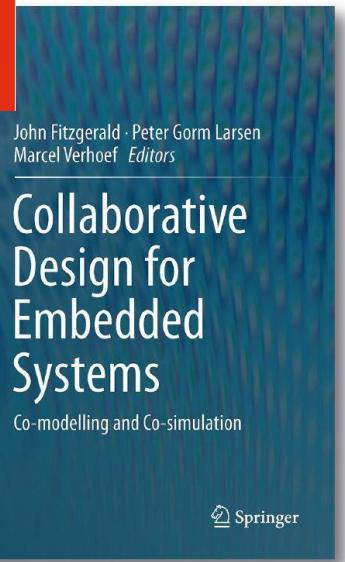

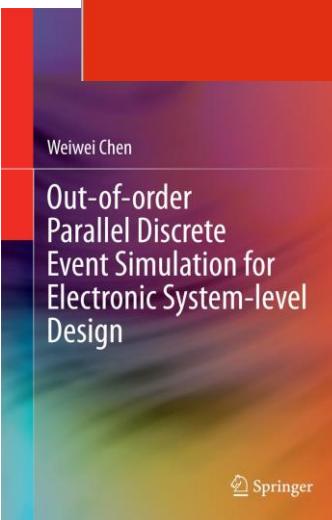

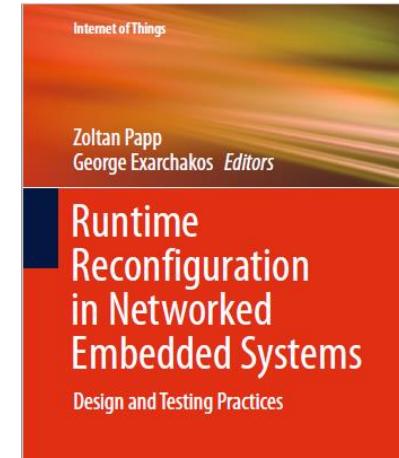

## Discrete event simulators

# DynAA !!!!

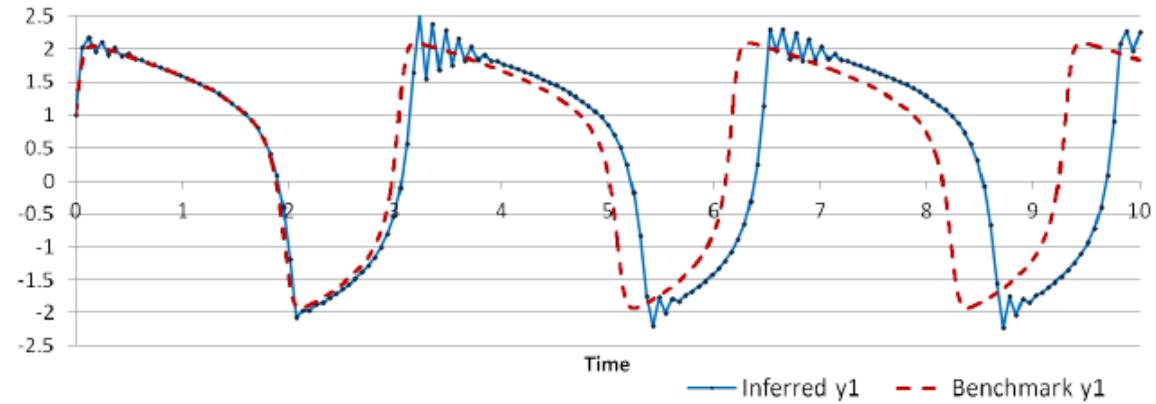

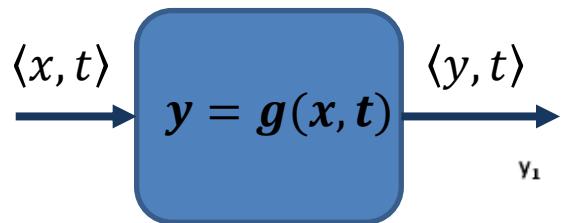

# MATLAB

<https://www.mathworks.com>

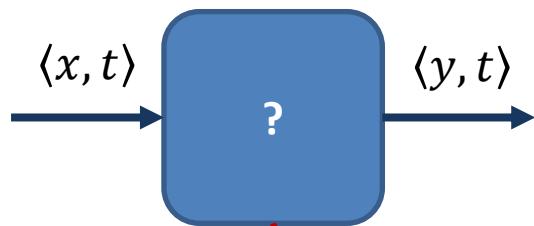

Find us Inside !

# Continuous simulations – the rules

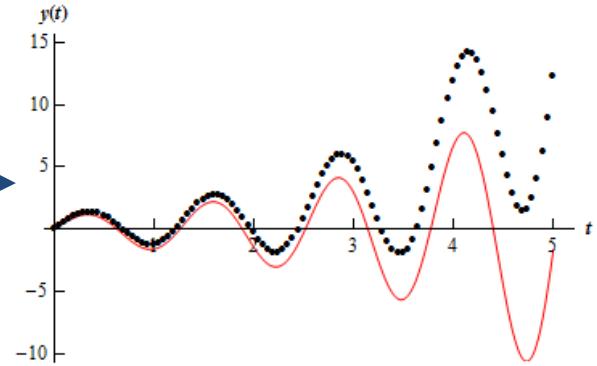

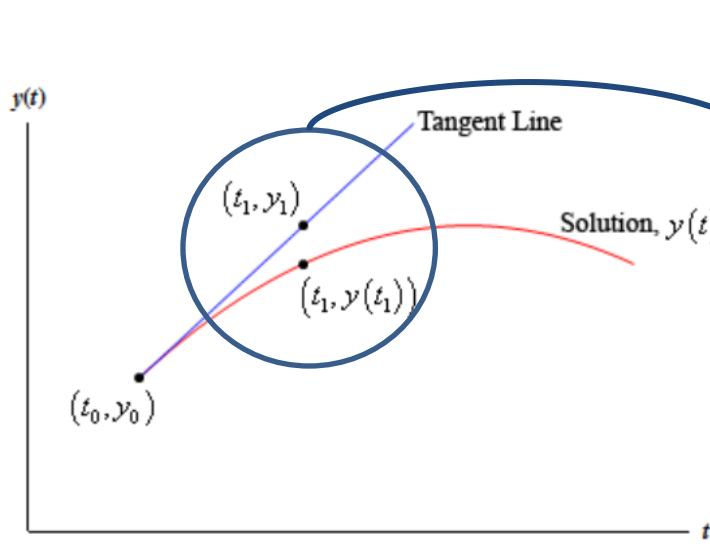

Play the game by advancing the time, step by step, and evaluating the function

$$f(t, y) = \frac{dy}{dt}$$

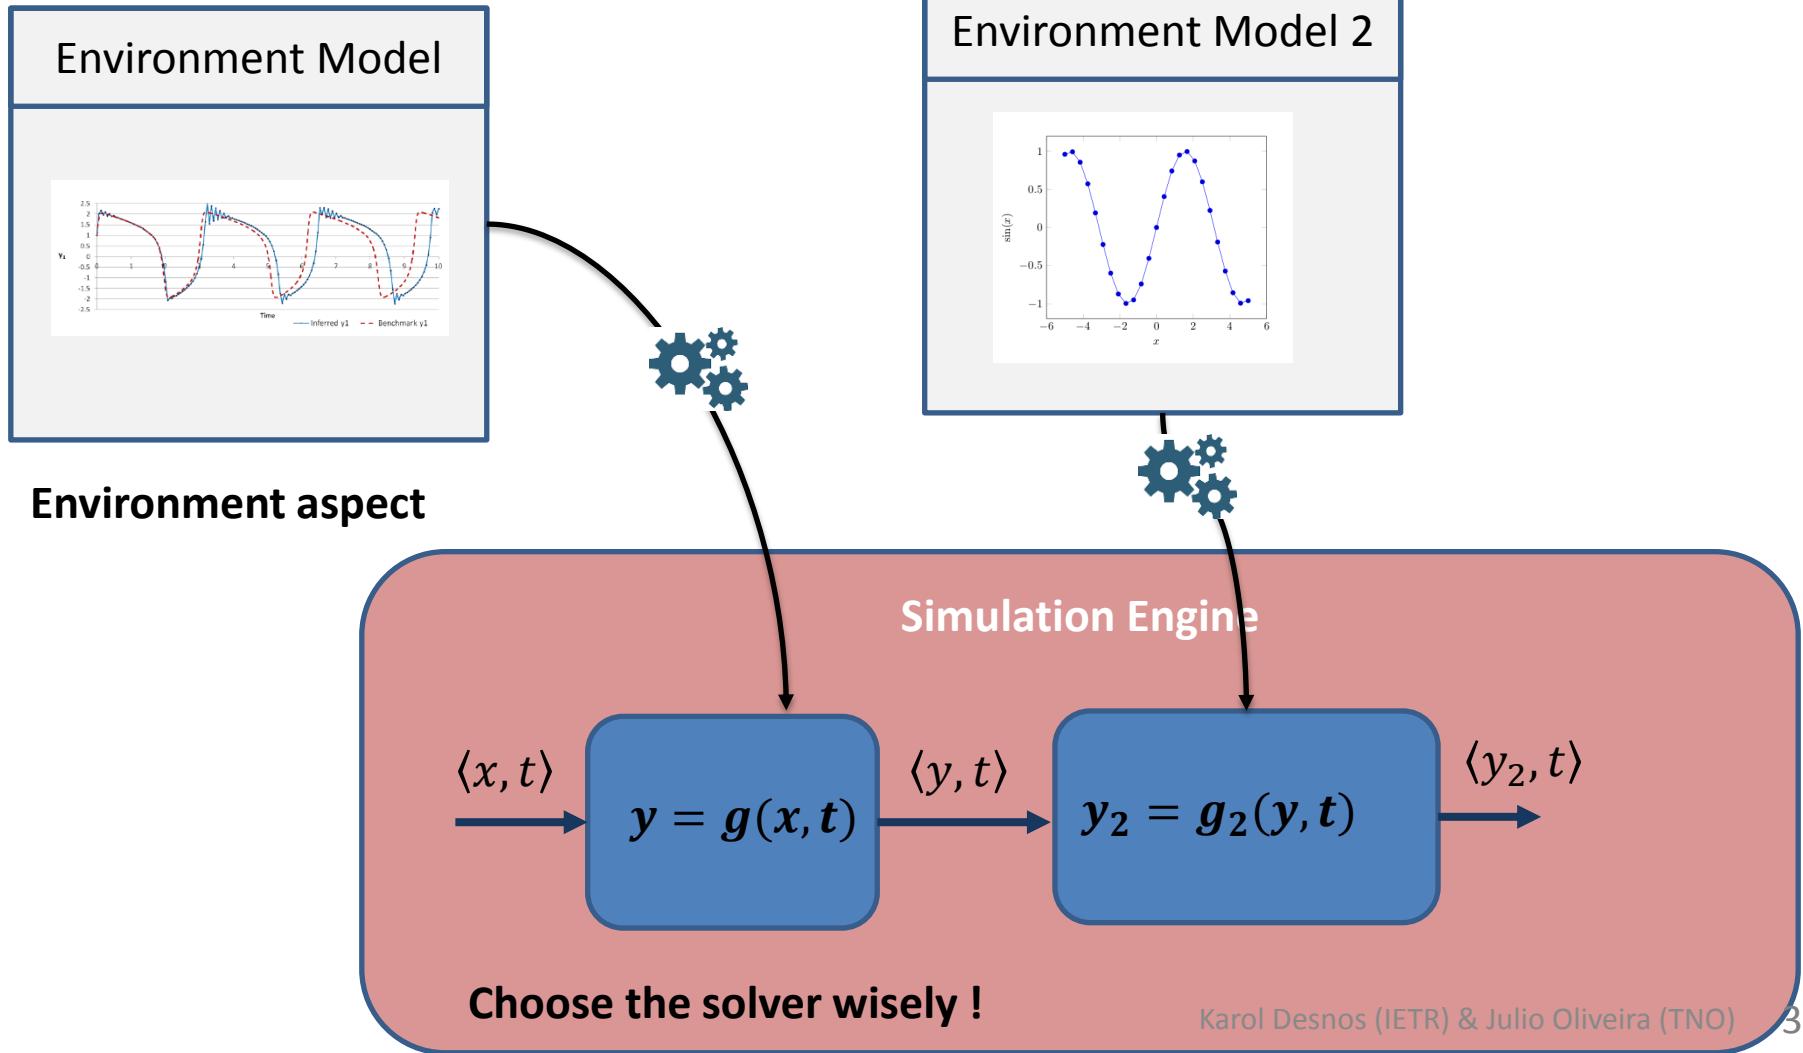

## Continuous simulations – the rules

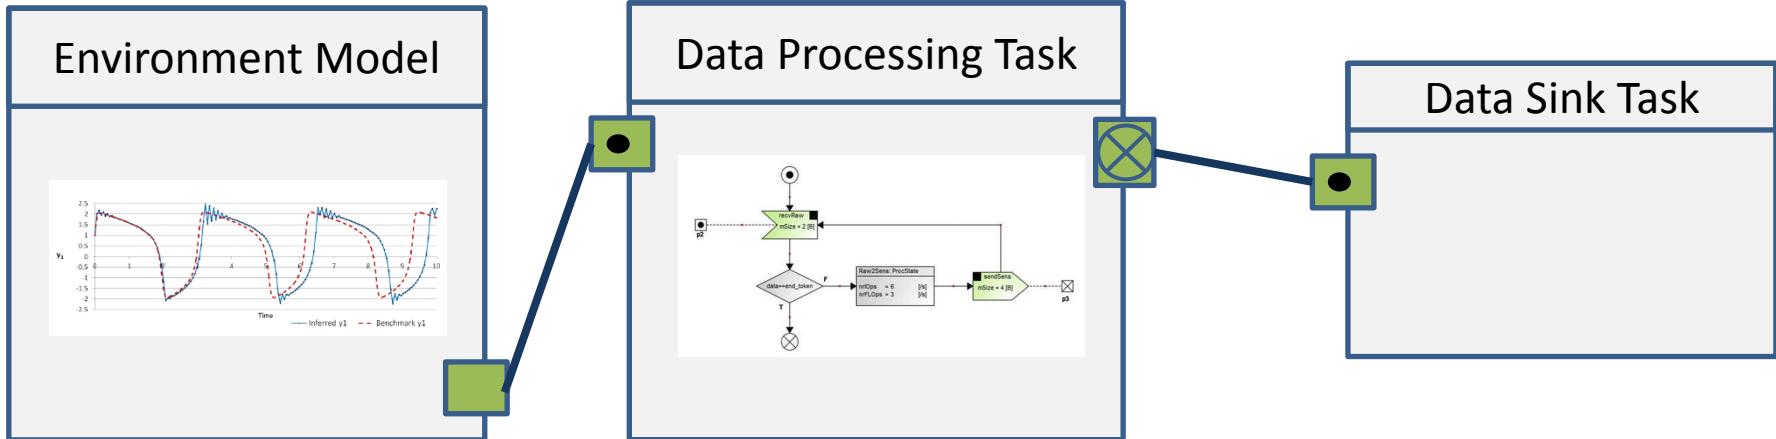

**Euler's method : the simplest solver**

1. **define**  $f(t, y)$ .
2. **input**  $t_0$  and  $y_0$ .
3. **input** step size,  $h$  and the number of steps,  $n$ .
4. **for**  $j$  from 1 to  $n$  **do**
  - a.  $m = f(t_0, y_0)$
  - b.  $y_1 = y_0 + h * m$
  - c.  $t_1 = t_0 + h$
  - d. Print  $t_1$  and  $y_1$
  - e.  $t_0 = t_1$
  - f.  $y_0 = y_1$
5. **end**

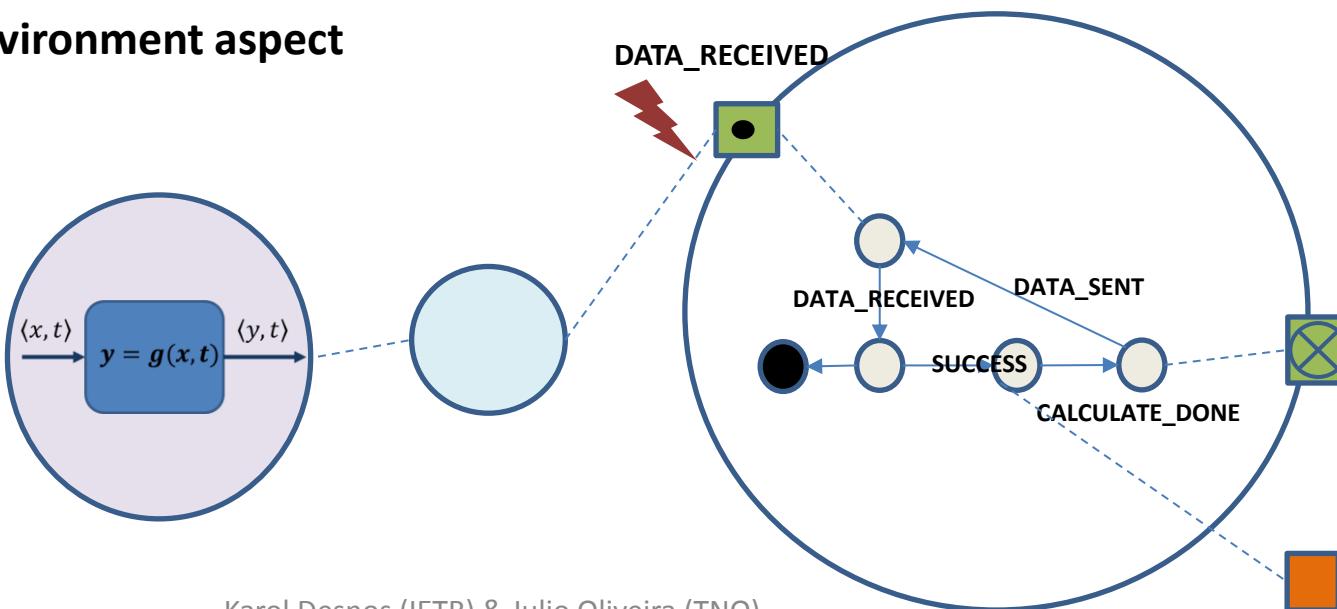

## Continuous simulation – Playing the game

## Short view on Hybrid simulation

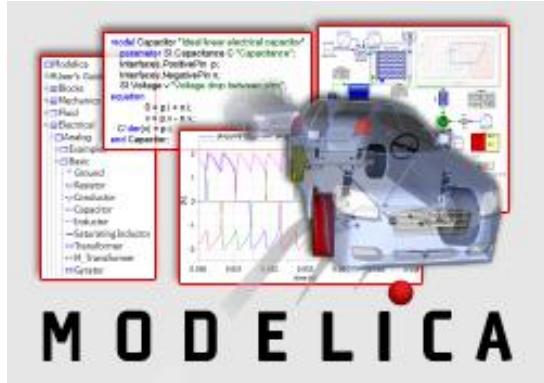

### Environment aspect

Looks the same, feels the same, but much more difficult !!!

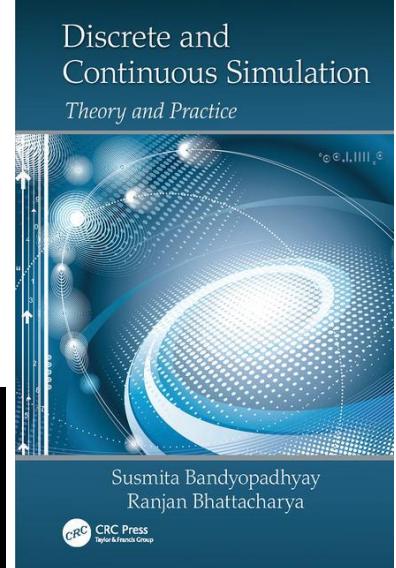

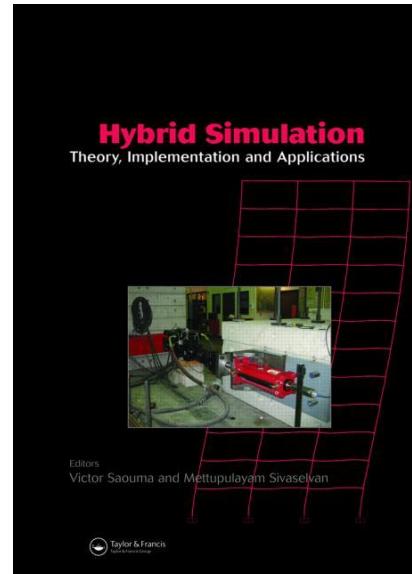

## Continuous (Hybrid) simulators

5. Runtime Support

# Runtime support

## Overview

### Runtime adaptation layer:

- Services needed to run an application
- Provided by “classic” OS, and/or model-aware utilities.

### Example: SPIDER Runtime

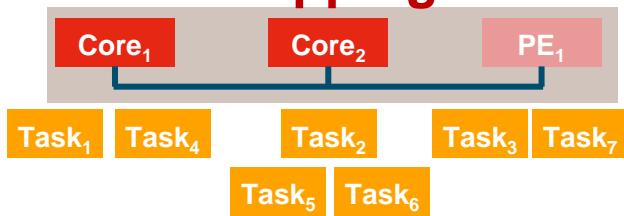

## Different Runtime Strategies

### Adaptivity++

	Mapping	Scheduling	Timing
fully dynamic	run	run	run
static-assignment	compile	run	run
self-timed	compile	compile	run
fully static	compile	compile	compile

Performance++

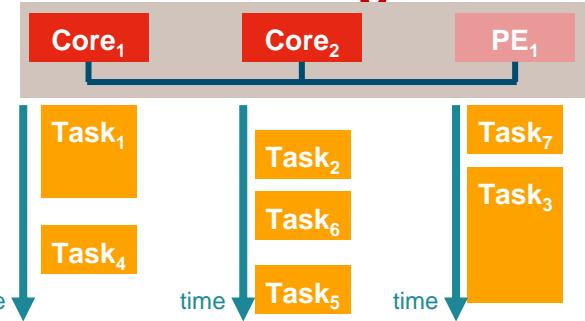

### Mapping

### Scheduling

### Timing

## Fully static runtime support

### Computation

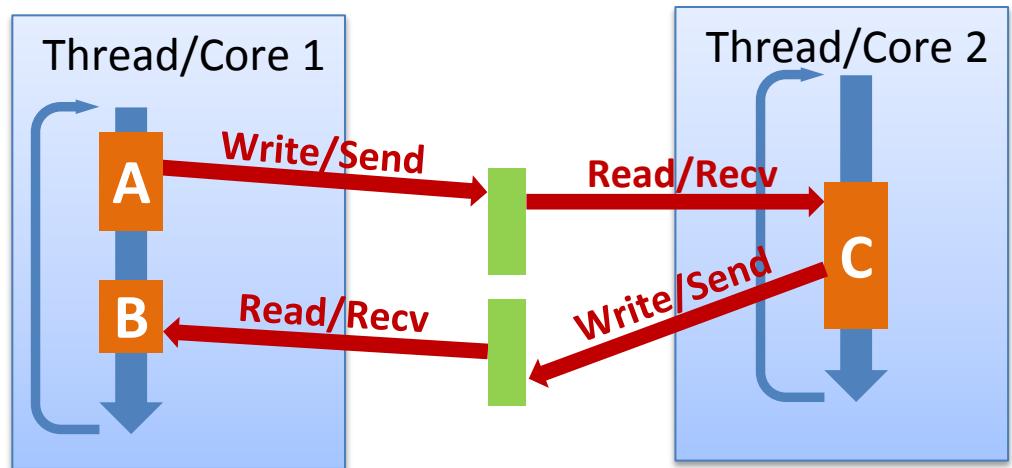

- Non-preemptible processes/threads
- Bare-metal or real-time OS
- Global clock

### Communications

- Non-blocking

### Used for:

- Hard Real-time systems

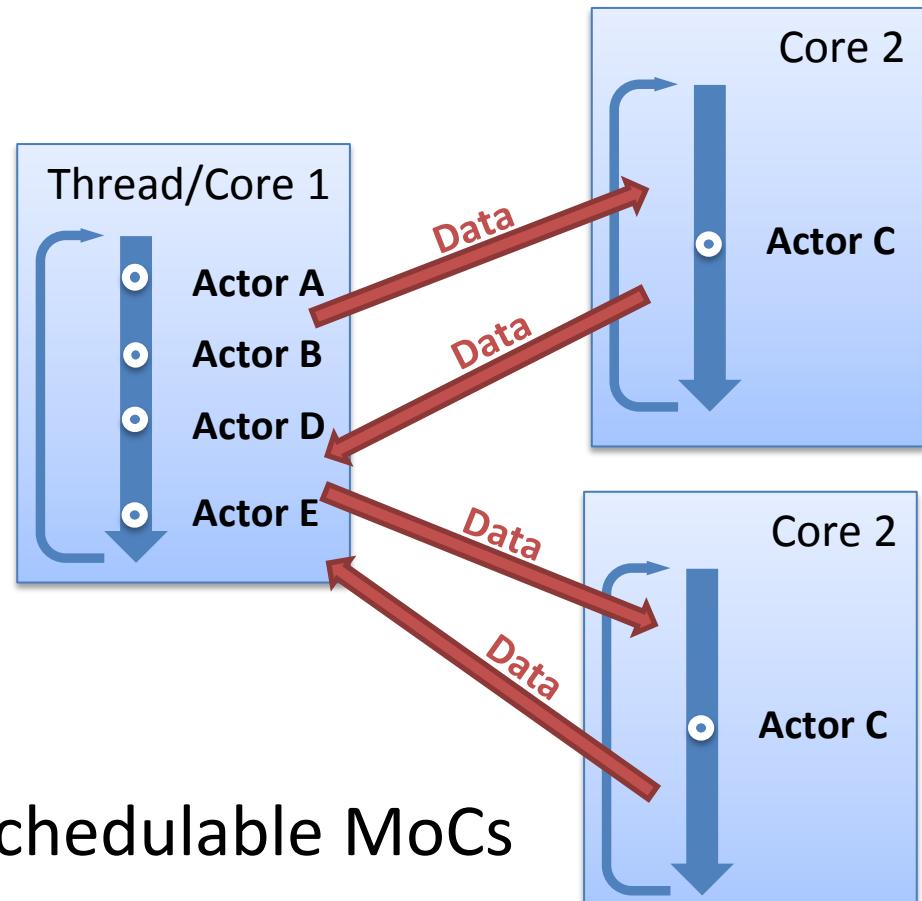

## Self-timed runtime support

### Computations

- Processes/threads/tasks
- Bare-metal or OS

### Communications

- Blocking
- Synchronization mechanism:  
Barrier, Mutexes,  
Semaphores, ...

### Used for/by:

- Real-time systems, statically schedulable MoCs
- E.g. Preesm, Syndex

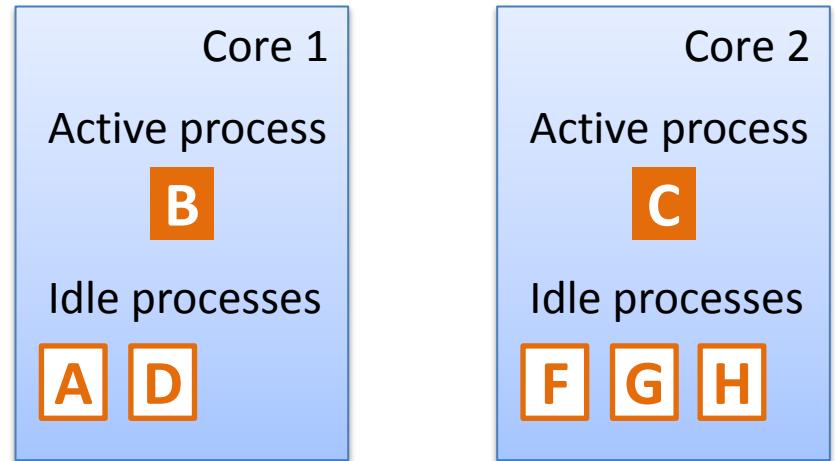

## Static assignment runtime support

### Computations

- Processes/threads/tasks
- OS with **scheduler**

### Communications

- Blocking
- Synchronization mechanism:  
Barrier, Mutexes,  
Semaphores, Yield...

### Used for/by:

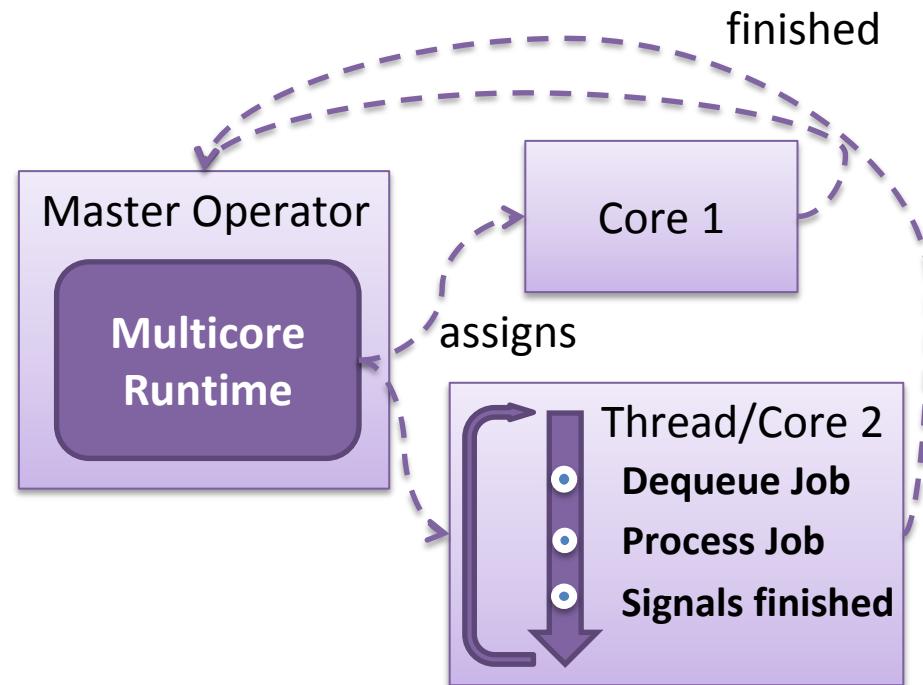

- Dynamic/Reconfigurable models (e.g. Kahn Process Network)
- E.g. Open RVC-CAL Compiler (ORCC), PaDaF

## Fully dynamic runtime supports

### Master/Slave model

- Pros:
  - Adaptivity
  - Controlled decisions
  - Compatible with heterogeneous target
- Cons:
  - Master overhead
  - Master bottleneck

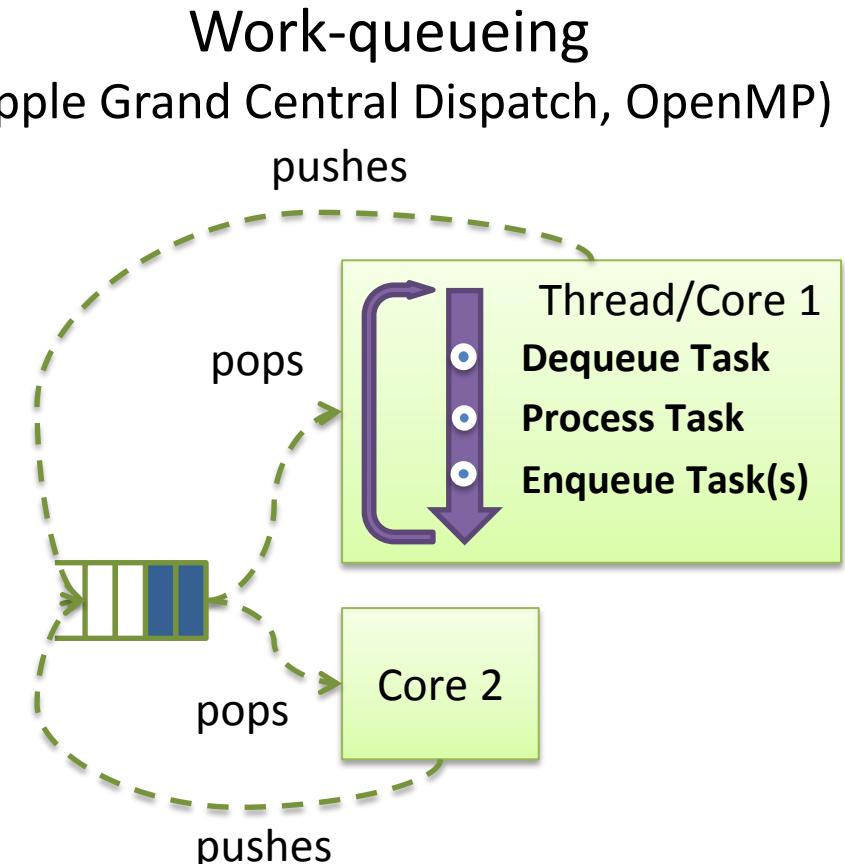

Master/Slave  
(e.g. Spider Runtime)

## Fully dynamic runtime supports

### Work queuing

- Pros:
  - Adaptivity
  - Light/No Overhead
- Cons:
  - Shared queue bottleneck
  - No “intelligence”
  - Non-determinist

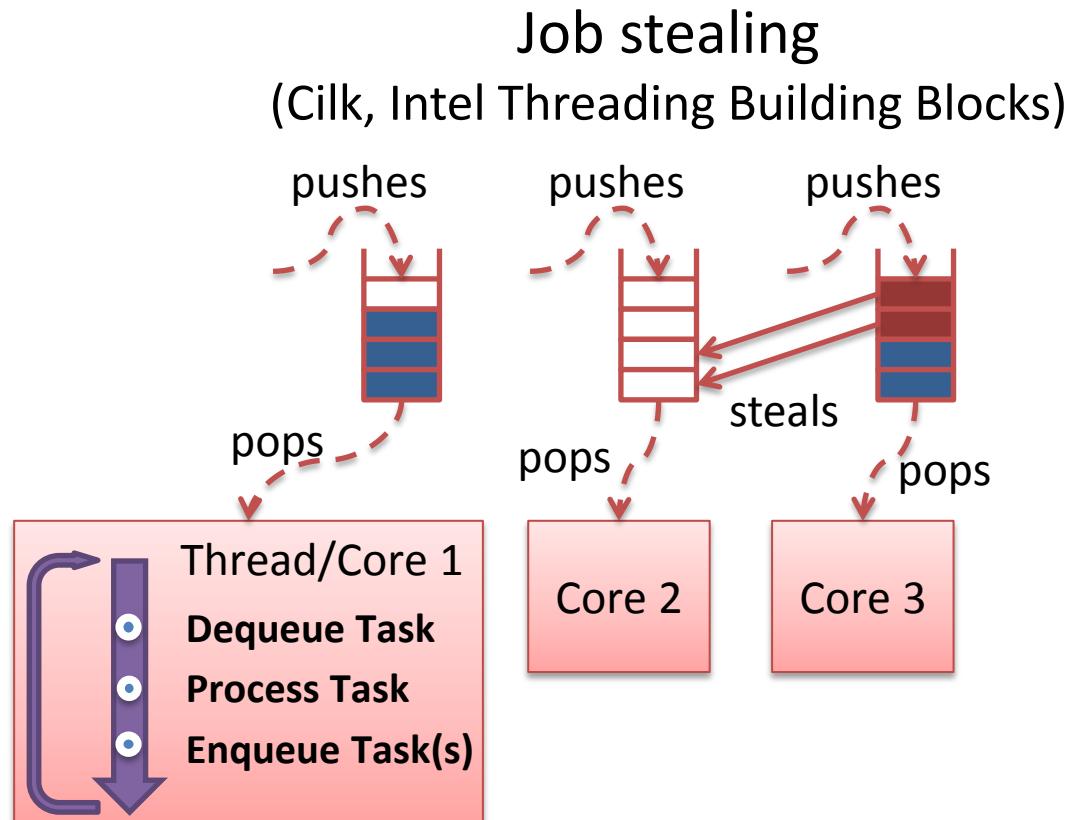

# Runtime support

## Fully dynamic runtime supports

### Job Stealing

- Pros:
  - Adaptivity
  - Light/No Overhead
  - No bottleneck
- Cons:
  - No “intelligence”
  - Non-determinist

# Final words

AN x64 PROCESSOR IS SCREAMING ALONG AT BILLIONS OF CYCLES PER SECOND TO RUN THE XNU KERNEL, WHICH IS FRANTICALLY WORKING THROUGH ALL THE POSIX-SPECIFIED ABSTRACTION TO CREATE THE DARWIN SYSTEM UNDERLYING OS X, WHICH IN TURN IS STRAINING ITSELF TO RUN FIREFOX AND ITS GECKO RENDERER, WHICH CREATES A FLASH OBJECT WHICH RENDERS DOZENS OF VIDEO FRAMES EVERY SECOND

BECAUSE I WANTED TO SEE A CAT JUMP INTO A BOX AND FALL OVER.

I AM A GOD.
